OHS RISK CONTROL PROCEDURE

Parent Policy Title	La Trobe University OHS Policy.												
Associated Documents	OHS Procedures												
Preamble	<p>One of the key health and safety principles of the Occupational Health and Safety Act 2004 is to ensure that those persons who manage or control things that create health and safety risks in the workplace are responsible for eliminating those risks. Where they can't be eliminated, they are responsible for reducing those risks so far as is reasonably practicable.</p> <p>What is 'reasonably practicable' in a given situation is determined objectively. In determining what is 'reasonably practicable', account must be taken of:</p> <ul style="list-style-type: none"> • the probability of a person being exposed to harm; • the potential seriousness of injury or harm; • what is known, or ought to be known, about the risk (people responsible for health and safety are required to inform themselves of current and relevant information) and how to eliminate it; and • the availability, suitability and cost of eliminating or reducing the risk. <p>A risk based approach to health and safety ensures the proper identification and evaluation of workplace hazards and enables those hazards either be eliminated, or controlled by suitable control measures.</p>												
General	<p>In order for La Trobe to comply with its legislative obligations to eliminate or control risks, it is essential that there be a systematic process of identifying and evaluating workplace risks. Completing and documenting risk assessments ensures workplace risks are properly assessed and provides a foundation to review and update assessments either periodically or in line with changes to the workplace.</p> <p>Managing risks in the workplace involves a number of key steps. These include hazard identification, assessing the risks associated with those hazards, and eliminating or controlling the risks. There are a number of tools to assist managers and supervisors in identifying, assessing and controlling risks in the workplace. The Workplace Environment and Wellbeing Unit has published a range of guidelines to assist staff in assessing and controlling workplace risks.</p>

	Documents and record keeping	6
1. Hazard Identification	<p>Hazard Identification is the process of identifying all situations or events that could give rise to the potential of injury or illness. Hazard identification and risk assessment must also accompany any proposal for the introduction of new equipment or processes or the modification of equipment or processes. Hazards can be grouped as physical, chemical, ergonomic, biological, or psychological</p> <p>Hazards can be identified through the following methods:</p> <ul style="list-style-type: none"> • Direct observation and reports from employees. • Previous incidents • Industry information • Health and Safety Committees • Hazard Identification checklists such as manual handling risk identification plant, planned OHS inspections, workstation • Consultants report • Material Safety Data Sheets 	
2. Risk Assessment	<p>Where a hazard has been identified, or when there have been significant changes to the way work is undertaken or modifications to plant or equipment, a risk assessment must be undertaken to determine the likelihood of injury or illness being caused by the hazard.</p> <p>The risk assessment will need to take into account the potential consequence of an adverse event occurring and the likelihood of the event occurring with that consequence. When assessing the risk associated with any hazard, the following matters are relevant:</p> <ul style="list-style-type: none"> • The persons exposed to the hazard • How often people are near the hazard • Previous incidents relating to the hazard • Legal requirements relating to the specific hazards • The context of the hazards (which may increase the likelihood of injury or illness occurring) 	
3. Assessment Process	<p>Risk analysis involves a consideration of the potential events (in the context of health and safety this includes injury, illness or property damage) that may arise and the consequences of those events. This requires a systematic approach to assessing hazards and provides an objective measure of the hazard and allows hazards to be prioritised. The <u>Risk Rating Matrix</u> can be used to assign a risk each hazard.</p> <p>The <u>Consequence</u> is the physical outcome of the hazard, including injury or illness to people and damage to equipment.</p>

CONSEQUENCE	EXAMPLE
Catastrophic	Numerous fatalities, irrecoverable property damage and productivity
Major	Approximately one single fatality, major property damage if hazard is realised
Moderate	Serious non-fatal injury, permanent disability
Medium	Disabling but not permanent injury
Minimal	Minor abrasions, bruises, cuts, first aid type injury.

The Likelihood can be described as follows:

LIKELIHOOD	EXAMPLE
Almost certain	Has happened, or could occur soon
Likely	Could easily happen
Possible	Could happen, and has either occurred before or could occur within a year or so
Unlikely	Has not been known to occur after many years of exposure
Rare	Exceptionally unlikely, even in the longer term

Risk Rating Matrix

	Consequence				
Likelihood	Minimal	Medium	Moderate	Major	Catastrophic
Rare	Low	Low	Medium	Significant	Significant
Unlikely	Low	Low	Medium	Significant	High
Possible	Low	Medium	Significant	High	High
Likely	Medium	Medium	Significant	High	Extreme
Almost certain	Medium	Significant	High	Extreme	Extreme

4. Control of Risks

Risk Prioritisation Chart

DESCRIPTION	ACTION
HIGH to EXTREME	A high or extreme risk requires immediate action to control the hazard as detailed in the hierarchy of controls, or the activity involving the hazard must cease.
MEDIUM to SIGNIFICANT	A medium or significant risk should be immediately controlled in the first instance. If this is not possible, temporary controls should be implemented and a planned approach be taken to control the hazard.

	<p>LOW</p>	<p>A risk identified as low may be considered as acceptable and further reduction may not be necessary.</p> <p>However, if the risk can be resolved quickly and efficiently, control measures should be implemented and recorded.</p>
<p>Risk control requires actions to be taken to eliminate or reduce the likelihood that exposure to a hazard will result in injury or disease. When determining control solutions consultation shall occur between competent persons undertaking the risk management process, employees affected health and safety representatives and the zone health and safety committee when required.</p> <p>When planning how hazards are to be controlled and risks reduced the following controls should be considered. This series of steps is called the hierarchy of risk control. Controls that act directly on the source of risk should be applied in the first instance where practicable, and only those methods that act on people be applied as a last resort. In many circumstances control solutions will incorporate a combination of controls.</p> <ul style="list-style-type: none"> • Eliminate the risk from the workplace. • Substitute the risk with something with a lower risk • Isolate the source of the risk • Use an engineering control • Change the work practices • Provide training • Provide protective gear <p>Some risks require immediate action, whereas others may take longer to put into place, in which case a Risk Control Plan should be developed. The Risk Control Plan should contain:</p> <ul style="list-style-type: none"> • A description of the hazards • Risk controls already in place • Short term actions to control the risk • Longer term actions required • The person with responsibility • The date for completion <p>Review of the control measures must be undertaken by the area manager to ensure that control measures are adequate.</p> <p>If practicable, there must be consultation with the relevant health and safety representative(s) when identifying, assessing and controlling risks. Consulting directly with employees and drawing on their experience and knowledge is more effective in reducing risk.</p>		
<p>5. Safe operating procedures</p>	<p>Where a risk has been identified, a safe operating procedure should be developed, promulgated and be regularly updated. The Safe Operating Procedure should contain a description of the hazard or risk, and the procedures necessary to ensure the tasks can be performed safely.</p>

	<p>It is important that employees are provided with the necessary information, instruction, training and skills to perform their work in a manner that is safe and without risks to health. It enables them to:</p> <ul style="list-style-type: none"> • Follow health and safety procedures; • Use risk controls set in place for their protection; • Have an appreciation of the nature of the hazard; the risks associated with their use; and the reason why risk controls are used.
6. Documents and record keeping	Each risk assessment must be fully documented. The risk assessment form must be completed by the risk assessment team and be approved by the manager of the area. Departments responsible for the hazards and their control are required to maintain all records of assessments for at least 5 years. (In some cases, legislative requirements will determine the minimum time to retain records)
Status	New Procedure
Approval Body	Executive OHS Committee, 14 September 2009, Minute 45.5
Initiating Body	Workplace Environment and Wellbeing Unit (OHS Committee)
Definitions	<p>Hazard: A source of potential harm to people or a situation with potential to cause injury or loss to plant, property or equipment.</p> <p>Hazard identification: Is the process of identifying all situations or events that could give rise injury, illness or damage to plant or property.</p> <p>Risk: A function of the probability of an adverse event occurring and the potential consequence of that event.</p> <p>Risk Assessment: A systematic approach to assessing hazards which provides an objective measure of the hazard and allows hazards to be prioritised and compared.</p> <p>Hazard and Risk Control: Is the process of implementing measures to reduce the risk associated with a hazard.</p> <p>Hierarchy of Control: Is the established priority order for the types of measures to be used to control risks.</p>
Date Effective	14 September 2009
Next Review Date	30 September 2013
Keywords	Hazard, risk, risk control, risk score
Owner/Sponsor	Director, Risk Management (from 2011)
